a. Specifies the maximum power allowed through the component. Performance and reliability under high power conditions must be determined within the user's setup.

b. All values are measured at room temperature at 650 nm without connectors through the black input port.

c. Ratio of the input optical power to the total optical power from all output ports. It is measured at the specified wavelength.

d. Does not include losses, as this is a measurement of the output power distribution only.

e. Includes both the split of the power between the two outputs, as well as any optical losses in the coupler.
